Where the first generations were only used for the rendering of graphics and related tasks, those of today are being

widely used in algorithms processing, media conversion and encoding, as well as playing the games. Throughout the late years of the previous millennium, the major problem for game developers was to create games that would be perceived as high-quality without the use of the - and even then, just the -. In just one sentence, graphics and physics computation (especially for realistic simulation) are the two major areas that GPU manufacturers have been focusing on. In this way, GPU manufacturers were forced to create something that could handle not only the raw processing of the graphics card, but also the complex algorithms. At some point, this gave rise to the so-called game experts who had skills in both math and programming, and therefore, the people who would code the algorithms that would take place on the graphics card. Video games started to develop a specific kind of consumers that would seek the latest high-end graphics cards and those that were able to take advantage of the latest and greatest algorithms. Thus, most game developers have aimed to reach the highest levels of quality and performance, and so it was that they started to use the algorithms of the so-called Game Development Frameworks (GDf), which were the new generation of graphics programming APIs (Application Programming Interface) that could be used by

the game developers to write the algorithms that would process in the graphics card. The GD

Still, the music and sound effects fit nicely with the whole game experience. So, for fans of indie games, Anna and the Rainbow Curse is a definite recommendation!
