Field of the Invention The present invention relates to a solid-state imaging device and a method of driving the solid-state imaging device. 2. Description of the Related Art A MOS type solid-state imaging device with a PN junction diode, that is, a CMOS sensor, which is disposed near a light receiving part, converts light into a photoelectric current by the PN junction diode, and accumulates the photoelectric current. The solid-state imaging device is driven by a so-called rolling shutter method. A frame is captured by the solid-state imaging device, and then the solid-state imaging device starts the capturing of each row in the same sequence, and ends the capturing of each row at the same time. In the frame, time is given to each row from the first row to the last row. When the solid-state imaging device starts capturing a frame, a difference between the image capture start time of each row is generated. A difference between the image capture start time of each row is accumulated, and when the solid-state imaging device captures a frame, the image capture start time of each row is compensated for.
